

The smart
teat sealant

eimü® Dry-Dip

External teat sealant
for dry-cows and heifers

eimü® Dry-Dip

During the dry cow period the risk for a mastitis infection is increased by various factors. Therefore eimü® Dry-Dip helps to protect your cows by sealing the teat channel from the outside with a durable barrier film. Especially your heifers can benefit from this easy to apply measure.

Seals the teat channel with a permanent protective film for up to 7 days

Offers additional protection during the critical phases after dry-off and prior to calving

Easily improves udder protection when internal seals (natural or artificial) start to weaken before calving

Suits any dry-cow management protocol and helps to reduce the use of antibiotics.

No hygiene risk compared to intra-mammary treatments

INSTRUCTIONS FOR USE

At Dry Off

At last milking prior to dry off, milk out cow completely. Clean and dry teats, then dip entire length of teat with eimü® Dry-Dip. For maximum protection, a second application may be applied after the first coating is dry.

10 Days Prior To Calving

Clean teats thoroughly and wipe with dry towel. Dip entire length of teat into eimü® Dry-Dip . Dip should remain on teat for 3–7 days. Observe daily and re-dip if sealant is removed prior to calving. After calving, peel off any remaining teat sealant prior to milking.

Item No. 20156 Pack size: 1000 ml
